

PulseCoach •

Presentation speaker script

A spoken talk track, slide by slide. Estimated total runtime: **10–12 minutes** at a natural speaking pace. Timings are a guide for pacing, not a stopwatch to read against.

01 Title

~30s

Good morning, everyone, and thanks for being here. Today we want to introduce PulseCoach: an AI-adaptive micro-workout coach. The promise is right there in the title — "Move more, decide less." In practice, the app picks three short sessions for you every day, tuned to how your body is actually feeling in that moment. We'll walk you through the product vision and the design system behind it.

02 Agenda

~20s

Here's the roadmap for today: we'll start with the problem and the market, then the product and its vision, how the adaptive engine works, and then we'll go deeper into the design system — color, type, components — closing on privacy and what's next.

03 Problem

~40s

The starting insight is simple: people don't abandon a fitness app because the workout is too hard. They abandon it because *deciding* is hard. Planning, choosing, logging — every tap before you even start moving is another chance to quit. The numbers back this up: roughly fifty percent of users lapse within the first month, the median person has under twenty-two minutes of protected free time, and a typical planning-first app asks for six or more decisions before movement even begins.

04 Opportunity

~35s

So why now? Three forces are converging. First, the science backs short, frequent movement — so-called "exercise snacks" — as genuinely effective. Second, physiological signals are everywhere: resting heart rate, steps, recent effort already stream from phones and wearables people already own. Third, AI now runs on-device, so we can personalize in real time without sending health data anywhere. PulseCoach lives exactly at that intersection.

05 Introducing

~35s

And here's the product: PulseCoach. Every day it picks three short sessions for you — mobility, cardio, breathing — and tunes them to how your body feels using on-device signals plus weather and air quality. The only decision left is to press start. Open the app, and thirty seconds later you're moving.

06 Vision

~30s

This is our vision, stated plainly: zero-planning fitness — movement that fits into any life, because the deciding has already been done for you. This is the north star that every product and design decision from here on serves.

07 How it works

~45s

Let's walk the adaptive loop, left to right. Inputs: on-device signals — resting heart rate, steps, recent effort — plus context like weather and air quality, and yesterday's effort feedback. The engine adapts intensity and session type. Output: today's three sessions, each with a plain-language reason attached. After every session, your feedback feeds back into tomorrow's plan — it's a closed loop that keeps learning.

08 Daily ritual

~40s

Let's look at the Today screen. At the top, the behavioral-state header tells you how the coach reads your readiness today. The completion ring tracks your three sessions at a glance. And the hero card is the single next thing to do — not a list of options, just one action ready to start. Below it, "coming up" shows what follows. One screen, one decision.

Point on screen: behavioral state, ring, hero card.

09 The why

~35s

This is a real differentiator: every AI recommendation explains itself in plain language. For example — "Intensity reduced today: high RPE yesterday, short recovery and elevated resting heart rate." The coach is gentle on hard days and celebratory on good ones. Transparency builds trust, and trust is what builds consistency.

10 Design philosophy

~30s

Now let's turn to the design system we built. The vibe is a calm cockpit for a five-minute workout — dark-first, deep near-black navy, teal as the one energetic accent. Surfaces are flat, no shadows — elevation is expressed purely as tint. Nothing shouts; your next session is always the loudest thing on the screen.

11 Color

~30s

On color: teal is primary — every action, every progress indicator, the completion ring. Violet and amber are the only other accents, reserved for behavioral states and difficulty. Session types get their own code too: mobility is teal, cardio is a soft rose, breathing is violet. And brand colors never change between dark and light mode — only the surfaces flip.

12 Typography

~40s

Typography follows one strict rule: two families, never mixed jobs. Plus Jakarta Sans carries everything you read as language — titles, buttons, coaching copy like "How did that feel?" JetBrains Mono is reserved purely for data — timers, live heart rate, RPE, weekly minutes. That separation is deliberate: numbers always look like data, prose never does, and it's what makes the product feel coherent and trustworthy on every screen.

13 Components

~30s

Everything you're seeing on this slide is a live component from the actual design system, not a mockup — the completion ring, the state indicator, type chips, difficulty dots, action buttons. Every screen and prototype composes from this same shared library, so design and code stay in lockstep.

14 Screens

~25s

Put together, the system assembles into three core surfaces: Today, Sessions, and Progress. Notice the parallel structure — every screen is built from the exact same components and tokens we just walked through.

15 Social

~40s

One Pro feature we want to call out: social, done the PulseCoach way. You add friends by handle or QR code — no contacts upload. An activity feed where reactions are a single tap, with no counts and no likes race. A friends-only leaderboard, so you're only ever ranked among people you chose. And shared sessions — one join code gives everyone a synchronized start, with per-person effort. Our goal was to bring people in without turning a calm coach into a competition.

16 Privacy

~30s

And privacy is a feature, stated plainly: all health data lives on your device, the adaptive AI runs locally, and nothing is ever sent to an external server. In a category built entirely on sensitive health signals, on-device by default is both an ethical stance and a real competitive edge.

17

Closing

~25s

So let's close where we started. PulseCoach removes the planning tax so consistency stops depending on willpower. Move more. Decide less. Thank you — we're happy to take any questions.
